REMARKS

1. White paste-like material at 4'1"-4'-2"

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

28-DAY TOXICITY TESTS WITH THE AMPHIPOD, LEPTOCHEIRUS PLUMULOSUS, USING WHOLE-SEDIMENT SAMPLES COLLECTED ON AUGUST 6, 2013 FROM THE WYNN MA, LLC EVERETT STAGING YARD IN EVERETT, MA

October 16, 2013

INTRODUCTION

This report contains results of toxicity tests performed using grab samples of nine estuarine sediments collected on August 6, 2013 from the Wynn MA, LLC's staging yard in Everett, MA. Toxicity tests with the whole sediment samples were conducted by exposing the saltwater amphipod, *Leptocheirus plumulosus*, to each of the nine sediment samples for 28 days in a static-renewal test system. All toxicity test work reported here was performed at New England Bioassay (NEB) in Manchester, CT.

MATERIALS AND METHODS

Sample Collection and Handling

Grab samples of nine estuarine sediments for toxicity screening were collected on August 6, 2013 from the Wynn MA, LLC's staging yard in Everett, MA. The samples were picked up from the GZA office in Norwood, MA and delivered to NEB by NEB courier on August 22, 2013 at 1400 h; the whole sediment samples were then stored refrigerated in their original containers until test set-up. Copies of chain of custody documentation are found in Appendix B.

Upon receipt at NEB, the sediment samples (1-gallon HDPE plastic containers) were logged into the laboratory (Table 1). The sediment samples were then stored in the dark in a cold room (4° ± 2°C) until testing. Free-standing water found in the original sample containers was used to represent pore water; the pore water was collected and then analyzed for salinity and total ammonia (Attachment 1). Before testing, the nine sediment samples were removed from the cold room and then manually stirred in their original containers to ensure homogeneity.

TABLE 1. DESCRIPTION OF ESTUARINE WHOLE SEDIMENT SAMPLES COLLECTED FROM EVERETT, MA

Observations on gross physical characteristics of sediment samples were then made. A description of each sample before test set-up can be found in Attachment 2.

In addition to testing site sediment samples, an artificial control sediment was evaluated as a quality-control check to determine adequacy of organisms and test system. The artificial control sediment was created based on EPA recommendations and consisted of natural sand and composted cow manure (Attachment 3). Control sediments were handled similarly to the site sediments.

After homogenization and characterization, between 2 cm and 5 cm of wet sediment was measured into 1L Pyrex glass beakers; a total of five beakers were prepared in this manner for each site sediment and the control sediment. Remaining sediment from each site was then stored in a cold room at 4° ± 2°.

Overlying water was added to each replicate beaker; gentle aeration of the overlying water was then initiated in all test and control beakers. After settling for about 4 h at the test temperature, aliquots of overlying water were removed from each sediment for total ammonia analysis; about 75% of the test solution was then removed and replaced with fresh overlying water. After test solution renewal, initial water quality measurements were performed; beakers containing the sediment and overlying water were then ready for introduction of test organisms.

Test Organisms

Leptocheirus plumulosus

Leptocheirus plumulosus, (Crustacea, Amphipoda) is an infaunal sediment-burrowing amphipod recommended as a test species for sediment tests (COE/EPA, 1994a, 1994b, 1995, 1998). This species is widely distributed in the estuarine and mesohaline portions of the Atlantic coast. Amphipods required for testing were obtained from an in-house culture. The amphipods were sorted by size through various sieves on August 27th to obtain the size needed for the sediment tests. The tests were initiated by loading 20 amphipods into each of the test and control beakers. A subsample of 40 amphipods was set aside for length measurements (Appendix A).

Test Water

Overlying water used in the whole-sediment toxicity tests was artificial saltwater (ASW) prepared using deionized water and Instant Ocean sea salts to a salinity of 20 ppt ± 2. The water preparation log can be found in Attachment 4.

Test Systems

L. plumulosus Whole-Sediment 28-Day Toxicity Tests

The amphipod toxicity test procedures are primarily based on recommendations in EPA/COE Inland Testing Manual (ITM) guidance documents (1994a; updated 1998); additional EPA guidance was also consulted (1994b, 2001). Immature amphipods were continuously exposed for 28 days under static-renewal conditions to sediment samples from each site. An artificial control sediment was evaluated similarly to the nine site sediments. Immature amphipods were exposed in groups of 20 animals in 1L Pyrex glass beakers containing 2-5 cm of sediment and filled with approximately 825 mls overlying laboratory-prepared saltwater, with five beakers per concentration (100 animals per sediment).

The test beakers for each sediment were placed in a controlled environmental chamber under the ITM specified test conditions (temperature 25° ± 2°C; photoperiod 16 h light and 8 h dark). After adding amphipods to the test chambers, the chambers were loosely covered to reduce evaporation.

All replicates received a change of the overlying water every Monday, Wednesday and Friday until test termination. Beakers were fed 2mls of crushed Tetramin flake three times a week after water renewal. To maintain adequate dissolved oxygen levels in the overlying water during testing, test and control beakers were continuously aerated (single bubble aeration) throughout the 28-day tests. At regular intervals, temperature, dissolved oxygen, pH, and salinity were measured in each sample and control (Appendix A). Samples of overlying water were taken on days 0 and 28 and sent to Phoenix Environmental Laboratories to monitor ammonia levels (Appendix B). Ammonia levels were also monitored on day 2 and day 14 in the lab using a salicylate-based color indicator to ensure they were not above the acceptable range (Attachment 1).

At test termination, the contents of each test chamber are sieved to isolate the test organisms. The mesh sizes for sieving the contents of the test chambers are 0.5 – 0.6 mm for adults and 0.25 mm for offspring. The sieved material from the large mesh sieve, which will include the adult amphipods, is rinsed into plexi-glass sorting trays and survival counts are performed. Amphipods and residual sediment retained on the 0.25mm sieve are rinsed into a labeled sample container using 70% isopropyl alcohol and a funnel supported by a ring stand. Approximately 3 ml of rose bengal solution is added to stain the organisms. If any young are observed while counting the adults in the sorting tray, the contents of the sorting tray are sieved again and added to the alcohol preserved container. The preserved young are counted within 2 weeks of test termination.

All live adult amphipods within a replicate were placed in pre-weighed drying pans and kept in a drying oven overnight (70°C). The following day, the weigh pans containing the dried amphipods were removed from the drying oven and placed in a desiccator. Amphipods were subsequently reweighed as a group using a 5-place balance. Total dry weight per replicate was then divided by number of amphipods weighed to obtain an average dry weight per surviving amphipod (Appendix A).

Reference Toxicant Test

An acute reference toxicant test (potassium chloride; KCl) was conducted with the same group of *L. plumulosus* collected for use in the sediment tests. The 96-h survival data were used to calculate an LC_{50} for *L. plumulosus*. The KCl test consisted of six nominal concentrations (125, 250, 500, 1000, 1500, and 2000 mg/L KCl) and a dilution-water control (ASW). The reference toxicant data can be found in Appendix B.

Statistical Analysis

Toxicity data from the amphipod tests were used to determine if the sediment samples exhibited significant effects on survival, growth and reproduction when compared with the test endpoints in laboratory control sediment (EPA, 1993, 1994c). Statistical analyses were run using the Comprehensive Environmental Toxicity Information System (CETIS v1.8.7.7), which uses an automated decision tree based on the EPA's flowchart for statistical analysis. Copies of data sheets and statistical summary printouts for the *L. plumulosus* toxicity tests are located in Appendix A.

RESULTS

Leptocheirus plumulosus 28-Day Toxicity Tests

Results of the *L. plumulosus* 28-day screening toxicity tests (test dates: August 28, 2013 – September 25, 2013) are summarized in Table 2. Survival of *L. plumulosus* in the NEB artificial control sediment was 91% after 28 days. Site sediment GZ-LC2T exhibited a statistically-significant reduction (Steel's many-one rank test; $P < 0.05$) in survival of *L. plumulosus* when compared with the survival in the artificial control. Survival in the eight remaining site sediments did not exhibit a statistically-significant reduction when compared with the artificial control. Survival in the site sediment samples ranged from 0% to 94% after a 28-day exposure.

Average weight of the *L.plumulosus* was 1.395 mg after 28 days in the artificial control. When the average weight of the nine site sediments was compared with the artificial control, a statistically-significant reduction was found in samples GZ-104T, GZ-114T, GZ-126T, GZ-137T, GZ-LC2T and GZ-LC3T (Dunnett Multiple Comparison Test; $P < 0.05$). There was no statistically-significant reduction in weight between the site samples GZ-116T, GZ-135T and GZ-LC1T when compared with the artificial control. Average weight in the site sediment samples ranged from 0 mg to 0.899 mg after a 28-day exposure.

Amphipods exposed to the artificial control sediment increased in dry weight by approximately 17.7-fold during the 28-day exposure. For the nine site sediments, dry weight increases over initial dry weights ranged from 4.1-fold for sample GZ-104T to 11.3-fold for GZ-LC1T.

There was a statistically-significant reduction in all of the site sediment samples for reproduction when compared against the artificial control, which had 382 young. However, the observations made on total number of offspring seem to correlate closely with the mean weights at 28-days. The three site sediment samples that did not have a statistically-significant reduction in weight compared with the artificial control, GZ-116T, GZ-135T and GZ-LC1T, also had the highest number of young at test termination; 115, 150 and 148, respectively. These three samples each had an average weight of $\geq$ 0.875mg. The remaining six site sediment samples, which were all found to have average weights that were significantly reduced from the control, had a noticeably smaller amount of young (Table 2).

Test Summary	**5.1-8.2**	**24.1-25.7**	**7.6-8.6**	**20-22**

Reference Toxicant Testing

The SDS 96-h LC_{50} was estimated for *L. plumulosus* using survival data generated from an acute reference toxicant test with the same cohort of amphipods used in sediment testing (test dates: 8/28/13 – 9/1/13). The 96-h LC_{50} for *L. plumulosus* was estimated at 12.074 mg/L SDS (Spearman method; confidence limits of 10.349 to 14.087 mg/L SDS). Survival of control amphipods was 100% at test completion (96 h).

SUMMARY

The least toxic samples appear to be GZ-116T, GZ-135T and GZ-LC1T. These three samples had the highest survival rate (≥ 83%), the highest average weights (≥ 0.875 mg) and the highest number of offspring (≥ 115). They did not exhibit any statistically-significant survival or weight reductions when compared with the control. The most toxic sample was GZ-LC2T, which had 0% survival at 28 days and produced no offspring. The remaining five site samples (GZ-104T, GZ-114T, GZ-126T, GZ-137T and GZ-LC3T) showed moderate toxicity. Their survival at 28-days was not significantly reduced when compared with the control, however their average weight at 28-days was significantly lower. They also produced lower amounts of offspring (≤ 55). A description of the overall test observations made by the technicians can be found in Attachment 5.

CERTIFICATION

I certify that the toxicity test data presented in this report were obtained under my direction or supervision in accordance with protocols of the U.S. Environmental Protection Agency, where applicable. The information is, to the best of my knowledge and belief, true, accurate, and complete.

* Free-standing water found in the original sample containers was used to represent "pore water."

Overlying Test Water Ammonia:

In order to determine the ammonia levels within the overlying water of each sediment test, samples of overlying water were collected on days 0 and 28, and sent to Phoenix Environmental Laboratories, Inc., in Manchester, CT.

Additional ammonia measurements were conducted at NEB using a salicylate-based color indicator. This was done to insure that the ammonia levels within the test chambers were not above the acceptable range. Otherwise, water changes would have been performed to reduce these ammonia levels (not found to be necessary in this case). See below:

ATTACHMENT 2

Descriptions of Sediment Samples

(At time of test pre-set)

Client: GZA GeoEnvironmental, Inc. Pre-set date: 8-27-13

Project: Everett, MA (01.171521.02 Task 6) Start date: 8-28-13

GZ-104 T / C33-3574: Black in color; smooth texture, fine-grained, with small stones and small snail shells; strong odor of petroleum.

GZ-114 T / C33-3575: Black in color; smooth texture, fine-grained, "pudding-like" consistency; shells of mussels and shells of oysters; faint odor of petroleum.

GZ-116 T / C33-3576: Black in color; sticky, but gritty, with small stones and clam shell fragments; faint odor of petroleum.

GZ-126 T / C33-3577: Dark gray in color; sticky, but gritty, with clam shell fragments; only natural odor detected.

GZ-135 T / C33-3578: Grayish black in color; sticky, heavy clay with sand, less fluid than the other samples; a razor clam shell was observed; only natural odor detected.

GZ-137 T / C33-3579: Black in color; smooth texture, fine grained, sticky; small clam shells observed; odor of petroleum noticeable.

GZ-LC 1 T / C33-3580: Dark gray in color; smooth, sticky and clay-like, with clam shells; small, live worms seen; faint odor of petroleum.

GZ-LC 2 T / C33-3581: Gray in color (lighter than the other samples); "fluffy" consistency, not dense or heavy; a few rocks were present, as well as shells of slipper-shell mollusks; strong odor of petroleum.

GZ-LC 3 T / C33-3582: Black in color; smooth, slippery texture, fine-grained, with a few small stones or shell fragments; odor of petroleum noticeable.

ATTACHMENT 3

Preparation of Artificial Control Sediment

(Saltwater version for *Leptocheirus plumulosus*)

Client: **GZA GeoEnvironmental, Inc.**

Project: **Everett, MA (01.171521.02 Task 6)**

Date prepared: **8-27-13**

Test pre-set date: **8-27-13**

Test setup date: **8-28-13**

Ingredients: Natural sand, sterilized natural marine sediment, and redart clay.
Artificial salt water (Instant Ocean™) used to increase pore water salinity.

Natural fine-grain sand was collected from a clean site in Huntington, MA. Portions of sand were rinsed through a 300 micron mesh. Sand grains small enough to pass through the mesh were further rinsed. The rinsed sand was stirred into artificial salt water, to provide the final product with increased pore-water salinity. The sand was allowed to settle, and the excess salt water was decanted.

Natural marine sediment was collected (7-30-13) from the Barn Island Wildlife Management Area in Stonington, CT. A portion of this sediment was sieved, then sterilized by microwaves in order to remove and/or destroy indigenous organisms. The sterilized sediment was allowed to cool.

Redart clay was obtained from Sheffield Pottery, Inc., in Sheffield, MA.

All ingredients were thoroughly blended together, and re-homogenized before use.

Amounts added:

Natural sand, ≤ 300 µm:	**660 ml**	(55% by volume)
Sterilized natural marine sediment:	**480**	(40% by volume)
Redart clay:	**60**	(5% by volume)

ATTACHMENT 5

Marine Sediment - Overall Test Observations

Client: GZA GeoEnvironmental, Inc. Start date: 8-28-13

Project: Everett, MA (01.171521.02 Task 6) End date: 9-25-13

At test initiation (Day 0), test organisms were added to all replicate beakers. For all samples (and the control sediment), the amphipods quickly swam downward through the overlying water, and entered the sediment almost immediately.

One day after test initiation, small tunnel entrances (holes) were clearly visible on the surface of the control sediment, and short tunnels (burrows) could be seen against the glass on the side of the beakers, near the bottom. All but one of the test samples exhibited this type of burrowing by Day 1. These burrows remained visible throughout the duration of the test, slowly becoming longer and more branched.

For sample sediment **GZ-LC 2 T,** no burrows or tunnel entrances were ever observed. In fact, the organisms disappeared on day zero, and were never seen again. There was absolutely no indication of life or activity in the beakers containing sample GZ-LC 2 T throughout the test period. This is in stark contrast with all other samples, (and the control sediment), where borrows were obvious, and organisms could occasionally be seen roaming the surface of the sediment (an activity that increased as the organisms became mature).

All tests were fed on a normal schedule, after a 40% water change occurring on Mondays, Wednesdays, and Fridays. Salinity increases (due to evaporation) were controlled thru these water changes.

No indigenous organisms were observed during the test period.

At test breakdown:

Visual observation of recovered test organisms:

The surviving test amphipods recovered from the **control sediment** (on day 28) appeared healthy, and relatively consistent in size. They also appeared larger than some of those that were recovered from the various sample sediments.

The following size descriptions were made visually, and should not be considered to be as reliable or precise as the (more objective) dry-weight data:

Artificial control: organisms larger, generally consistent in size.

GZ-104 T: Mixed sizes, some organisms larger, others small and weak-looking. The largest organisms were found in replicate **D** (survival = 17), while the smallest organisms were found in replicate **A** (survival = 1) and in replicate **E** (survival = 6).

GZ-114 T: Most organisms were smaller than the control organisms, but to varying degrees. Those that appeared the most similar in size to the control organisms were found in the replicate having the highest survival (replicate **C**, survival = 18); however, smaller organisms were found in replicate **D**, were the survival was nearly as high (replicate **D,** survival = 17).

GZ-116 T: Organisms appeared only somewhat smaller than those found in the control sediment.

GZ-126 T: Organisms appeared noticeably smaller than those found in the control sediment.

Marine Sediment - Overall Test Observations (Page 2)

Client: GZA GeoEnvironmental, Inc. Start date: 8-28-13

Project: Everett, MA (01.171521.02 Task 6) End date: 9-25-13

GZ-135 T: Organisms in replicate **E** appeared smaller than those in the other replicates (survival was high in all replicates).

GZ-137 T: Organisms in replicate **C** appeared larger than those in the other replicates (survival in replicate **C** = 19). The organisms appeared smaller in all other replicates (besides replicate **C**); however, survival was equally as high in replicate **D** (survival = 19). So, the size difference did not appear to correspond with any particular difference in survival.

GZ-LC 1 T: Organisms appeared bigger in replicates **C**, **D**, and **E**, but were moderately smaller in replicates **A** and **B**. (Survival was generally high, except in replicate **B**, where survival = 6.)

GZ-LC 2 T: Absolutely no organisms were ever seen in sample **GZ-LC 2 T** after they were added on Day 0.

GZ-LC 3 T: The organisms recovered from replicate **A** were larger, while those found in the other replicates appeared smaller.

Additional Observations:

One live sand worm (2-3 inches long) was found in replicate **B** of sediment **GZ-116 T**. Another live sand worm (appx. 1.5 inches) was found in replicate **D** of sediment **GZ-126 T**.

A **very strong, undefined, chemical odor** was given off by the process of seiving sediment **GZ-LC 2 T** at test breakdown.

CHAIN OF CUSTODY DOCUMENTS

PHOENIX
Environmental Laboratories, Inc.

Tuesday, September 10, 2013

Attn: Ms. Kim Wills
New England Bioassay
a Division of GZA GeoEnvironmental
77 Batson Drive
Manchester, CT 06040

Project ID: GZA EVERETT
Sample ID#s: BF34874 - BF34884

This laboratory is in compliance with the NELAC requirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

Phyllis Shiller

SUMMARY

Client:	GZA GeoEnvironmental, Inc.
Site:	Wynn Casino Site in Everett, MA
GZA Job Number:	01.171521.13 Task 1
Test Materials:	Whole Sediment Samples (Estuarine)
Sample Date:	March 24-30, 2015 (12 Whole Sediment Samples)
Delivery Date:	April 21, 2015
Test Type:	28-day Single Concentration Survival & Growth Toxicity Tests with the Amphipod, *Leptocheirus plumulosus*
Test Endpoint:	28-day survival, growth & reproduction
Test Dates:	April 30, 2015 – May 28, 2015

28-DAY TOXICITY TESTS WITH THE AMPHIPOD, LEPTOCHEIRUS PLUMULOSUS, USING WHOLE-SEDIMENT SAMPLES COLLECTED MARCH 24-30, 2015 FROM THE WYNN MA, LLC EVERETT STAGING YARD IN EVERETT, MA

June 16, 2015

INTRODUCTION

This report contains the results of toxicity tests performed using grab samples of twelve estuarine sediments collected between March 24th and March 30th, 2015 from the Wynn Casino site in Everett, MA. Toxicity tests with the whole sediment samples were conducted by exposing the saltwater amphipod, *Leptocheirus plumulosus*, to each of the twelve sediment samples for 28 days in a static-renewal test system. All toxicity test work reported here was performed at New England Bioassay (NEB) in Manchester, CT.

MATERIALS AND METHODS

Sample Collection and Handling

Grab samples of twelve estuarine sediments for toxicity screening were collected March 24-30, 2015 from the Wynn Casino site in Everett, MA. The samples were picked up from the GZA office in Norwood, MA and delivered to NEB by NEB courier on April 21, 2015 at 1220 h; the whole sediment samples were then stored refrigerated in their original containers until test set-up. Copies of chain of custody documentation are found in Appendix B.

Upon receipt at NEB, the sediment samples (1-gallon HDPE plastic containers) were logged into the laboratory (Table 1). The sediment samples were then stored in the dark in a cold room (4° ± 2°C) until testing. Free-standing water found in the original sample containers was used to represent pore water; the pore water was collected and then analyzed for salinity and total ammonia (Appendix A). Before testing, the twelve sediment samples were removed from the cold room and then manually stirred in their original containers to ensure homogeneity.

TABLE 1. DESCRIPTION OF ESTUARINE WHOLE SEDIMENT SAMPLES COLLECTED FROM EVERETT, MA

Sample Description	Sample Date	Sample Type	NEB COC Nos.
	Whole Sediments		
LC-102	3/26/15	Grab	C35-1873
LC-105	3/26/15	Grab	C33-1874
LC-112	3/27/15	Grab	C33-1875
GZ-203	3/24/15	Grab	C33-1876
GZ-207	3/25/15	Grab	C33-1877
GZ-209	3/25/15	Grab	C33-1878
GZ-213	3/25/15	Grab	C33-1879
GZ-214	3/30/15	Grab	C33-1880
GZ-217	3/24/15	Grab	C33-1881
GZ-223	3/30/15	Grab	C33-1882
GZ-224	3/30/15	Grab	C33-1883
GZ-225	3/27/15	Grab	C33-1884

Observations on gross physical characteristics of sediment samples were then made. A description of each sample before test set-up can be found in Appendix A.

In addition to testing site sediment samples, an artificial control sediment and a natural control sediment were evaluated as quality-control checks to determine adequacy of organisms and test system. The artificial control sediment was created based on EPA recommendations and consisted of natural sand, sterilized natural marine sediment and redart clay (Appendix A). Control sediments were handled similarly to the site sediments. Performance criteria established for this test includes the average survival of amphipods in the control treatment must be greater than or equal to 80% and there must be measurable growth and reproduction in all replicates. Both the artificial and natural controls did have measurable growth and reproduction in all replicates, however neither had 80% survival at test termination. The artificial control survival was 62% and the natural control survival was 71%. According to "Method for Assessing the Chronic Toxicity of Marine and Estuarine Sediment-associated Contaminants with the Amphipod *Leptocheirus plumulosus*" EPA600/R-01/020 "*Test failures usually can be attributed to a failure to maintain one or more test requirements described in Tables 11.1 and 11.3; however, tests sometimes fail inexplicably.*" Salinity, pH, sediment grain size, ammonia and temperature conditions as recommended in the aforementioned tables were consistently met in both the artificial and natural controls. Additionally, the *L.plumulosus* reference toxicant tests set in April and May, 2015 were both within the acceptable range. We are considering this test to be conditionally valid because three reference site sediments were also

included, and all three reference sites passed the survival, growth and reproduction performance criteria for test controls. These reference sites can provide a site-specific basis for evaluating toxicity.

After homogenization and characterization, between 2 cm and 5 cm of wet sediment was measured into 1L Pyrex glass beakers; a total of five beakers were prepared in this manner for each site sediment and the control sediment. Remaining sediment from each site was then stored in a cold room at 4° ± 2°.

Overlying water was added to each replicate beaker; gentle aeration of the overlying water was then initiated in all test and control beakers. After settling for about 4 h at the test temperature, aliquots of overlying water were removed from each sediment for total ammonia analysis; about 75% of the test solution was then removed and replaced with fresh overlying water. After test solution renewal, initial water quality measurements were performed; beakers containing the sediment and overlying water were then ready for introduction of test organisms.

Test Organisms

Leptocheirus plumulosus

Leptocheirus plumulosus, (Crustacea, Amphipoda) is an infaunal sediment-burrowing amphipod recommended as a test species for sediment tests (COE/EPA, 1994a, 1994b, 1995, 1998). This species is widely distributed in the estuarine and mesohaline portions of the Atlantic coast. Amphipods required for testing were obtained from in-house cultures. The amphipods were sorted by size on April 30th to obtain the appropriate age/size needed for the sediment tests. The tests were initiated by loading 20 amphipods into each of the test and control beakers. A subsample of 40 amphipods was set aside for length measurements (Appendix A).

Test Water

Overlying water used in the whole-sediment toxicity tests was artificial saltwater (ASW) prepared using deionized water and Instant Ocean sea salts to a salinity of 20 ppt ± 2. The water preparation log can be found in Attachment 4.

Test Systems

L. plumulosus Whole-Sediment 28-Day Toxicity Tests

The amphipod toxicity test procedures are primarily based on recommendations in EPA/COE Inland Testing Manual (ITM) guidance documents (1994a; updated 1998); additional EPA guidance was also consulted (1994b, 2001). Immature amphipods were continuously exposed for 28 days under static-renewal conditions to sediment samples from each site. An artificial control sediment was evaluated similarly to the twelve site sediments. Immature amphipods were exposed in groups of 20 animals in 1L Pyrex glass beakers containing 2-5 cm of sediment and filled with approximately 825 mls overlying laboratory-prepared saltwater, with five beakers per concentration (100 animals per sediment).

The test beakers for each sediment were placed in an environmentally controlled room under the ITM specified test conditions (temperature 25° ± 2°C; photoperiod 16 h light and 8 h dark). After adding amphipods to the test chambers, the chambers were covered with a plastic board to reduce evaporation. The board contained an aeration apparatus and small holes for venting.

All replicates received a change of the overlying water every Monday, Wednesday and Friday until test termination. Beakers were fed 2mls of crushed Tetramin flake three times a week after water renewal. To maintain adequate dissolved oxygen levels in the overlying water during testing, test and control beakers were continuously aerated (single bubble aeration) throughout the 28-day tests. At regular intervals, temperature, dissolved oxygen, pH, and salinity were measured in each sample and control (Appendix B). Samples of overlying water were taken on days 0 and 28 and sent to Phoenix Environmental Laboratories to monitor ammonia levels (Appendix C). Ammonia levels were also monitored on day 2 to ensure they were not above the acceptable range (Appendix A).

At test termination, the contents of each test chamber are sieved to isolate the test organisms. The mesh sizes for sieving the contents of the test chambers are 0.5 – 0.6 mm for adults and 0.25 mm for offspring. The sieved material from the large mesh sieve, which will include the adult amphipods, is rinsed into plexi-glass sorting trays and survival counts are performed. Amphipods and residual sediment retained on the 0.25mm sieve are rinsed into a labeled sample container using 91% isopropyl alcohol and a funnel supported by a ring stand. Approximately 3 ml of rose bengal solution is added to stain the organisms. If any young are observed while counting the adults in the sorting tray, the contents of the sorting tray are sieved again and added to the alcohol preserved container. The preserved young are counted within 2 weeks of test termination.

All live adult amphipods within a replicate were placed in pre-weighed drying pans and kept in a drying oven (100°C) for a minimum of six hours. After six hours, the weigh pans containing the dried amphipods were removed from the drying oven and placed in a desiccator. Amphipods were subsequently reweighed as a group using a 5-place balance. Total dry weight per replicate was then divided by number of amphipods loaded at test initiation (20 per replicate) to obtain an average biomass.

Reference Toxicant Test

An acute reference toxicant test (potassium chloride; KCl) was conducted with the same group of *L. plumulosus* collected for use in the sediment tests. The 96-h survival data were used to calculate an LC_{50} for *L. plumulosus*. The KCl test consisted of six nominal concentrations (125, 250, 500, 1000, 1500, and 2000 mg/L KCl) and a dilution-water control (ASW). The reference toxicant data can be found in Appendix C.

Statistical Analysis

Toxicity data from the amphipod tests were used to determine if the sediment samples exhibited significant effects on survival, growth and reproduction when compared with the test endpoints in laboratory control sediment (EPA, 1993, 1994c). Statistical analyses were run using the Comprehensive Environmental Toxicity Information System (CETIS v1.8.8.0), which uses an automated decision tree based on the EPA's flowchart for statistical analysis. Survival was calculated by the ratio of the number of living adults at test termination out of the initial organism count of 20 at test initiation. Biomass was calculated as the average growth in mg per site divided by the initial organism count of 20 at test initiation. Reproduction was calculated by taking the number of neonates per surviving adult in each replicate, then averaging that across all 5 replicates. Copies of data sheets and statistical summary printouts for the *L. plumulosus* toxicity tests are located in Appendix B.

RESULTS

Leptocheirus plumulosus 28-Day Toxicity Tests

Results of the *L. plumulosus* 28-day screening toxicity tests (test dates: April 30, 2015 – May 28, 2015) are summarized in Tables 2-6. Survival, biomass and reproduction in the site sediment samples GZ-203, GZ-207, GZ-209, GZ-213, GZ-214, GZ-217, GZ-223, GZ-224, GZ-225 were compared with three reference sites LC-102, LC-105, LC-112 and with the laboratory artificial and natural controls.

Survival and biomass of the *L.plumulosus* in the NEB artificial control sediment was 62% and 0.8779 mg, respectively, after 28 days. None of the site or reference sediments exhibited a statically significant decrease in survival or biomass when compared with the artificial control. Average number of young per surviving adult was 1.73, site sediments GZ-213, GZ-217 and GZ-224 had statistically reduced number of young when compared to the artificial control.

Survival of the *L.plumulosus* in the NEB natural control sediment was 71% after 28 days. None of the site or reference sediments exhibited a statistically significant decrease in survival when compared with the natural control. Average biomass was 1.035 mg in the natural control, GZ-217 with a biomass of 0.538, exhibited a significant decrease in biomass compared to the natural control. Average reproduction was 1.352 in the natural control, GZ-217 with reproduction of 0.1511 and GZ-224 with reproduction of 0.1184, exhibited significant decreases in reproduction compared to the natural control.

Survival of the reference site LC-102 was 83% after 28 days. GZ-217, with a survival of 57%, was significantly lower than LC-102. Average biomass was 1.586 mg in LC-102. GZ-217 with a biomass of 0.538, GZ-224 with a biomass of 0.9412 and GZ-225 with a biomass of 1.021 showed a significate reduction compared with LC-102. Average reproduction was 2.366 in LC-102. GZ-213 with reproduction of 0.3294, GZ-214 with reproduction of 0.8542, GZ-217 with reproduction of 0.1511 and GZ-224 with reproduction of 0.1184 showed a significant decrease when compared with LC-102.

Survival of the reference site LC-105 was 87% after 28 days. GZ-217, with a survival of 57%, was significantly lower than LC-105. Average biomass was 1.772 mg in LC-105. LC-112 with a biomass of 1.42, GZ-207 with a biomass of 1.272, GZ-213 with a biomass of 1.167, GZ-217 with a biomass of 0.538, GZ-224 with a biomass of 0.9412 and GZ-225 with a biomass of 1.021 showed a significant reduction in biomass when compared with LC-105. Average reproduction was 1.519 young per surviving adult in LC-105. GZ-217 with reproduction of 0.1511 and GZ-224 with reproduction of 0.1184 showed a significant decrease when compared with LC-105.

Survival of the reference site LC-112 was 85% after 28 days. GZ-217, with a survival of 57%, was significantly lower than LC-112. Average biomass was 1.42 mg in LC-112. GZ-217 with a biomass of 0.538 and GZ-224 with a biomass of 0.9412 showed a significant reduction in biomass when compared with LC-112. Average reproduction was 2.081 young per surviving adult in LC-112. GZ-213 with reproduction of 0.3294, GZ-217 with reproduction of 0.1511 and GZ-224 with reproduction of 0.1184 showed a significant decrease when compared with LC-112.

Amphipods exposed to the artificial and natural control sediment increased in biomass by approximately 13.1-fold and 15.4-fold, respectively, during the 28-day exposure. For the twelve site sediments, biomass increases over initial biomass ranged from 8.03-fold for sample GZ-217 to 26.4-fold for LC-105. Fold change for each sample can be found in Table 7.

Reference Toxicant Testing

The SDS 96-h LC_{50} was estimated for *L. plumulosus* using survival data generated from an acute reference toxicant test with the same cohort of amphipods used in sediment testing (test dates: 4/23/15 – 4/27/15). The 96-h LC_{50} for *L. plumulosus* was estimated at 17.08 mg/L SDS (Spearman method; confidence limits of 15.96 to 18.27 mg/L SDS). Survival of control amphipods was 100% at test completion (96 h). A reference toxicant chart can be found in Appendix C.

CONCLUSION

All three reference sites collected showed a similar performance with survival ranging from 83-87%, biomass ranging from 1.42-1.772 and reproduction ranging from 1.519-2.366. The consistency of the results produced by these three sites gives a good indication of the performance of ambient/naturally occurring sediment located specifically in the geographic area the site samples were taken in Everett, MA. Using these reference sites as a baseline for comparison, site sample GZ-217 showed the most toxicity. GZ-217 showed statistically significant reductions in survival, biomass and reproduction when compared with all three reference sites. GZ-217 was the only site sample that showed a statistically significant reduction in survival when compared with the reference sites. GZ-224 also exhibited toxicity in the sublethal endpoints, having statistically significant reductions in biomass and reproduction when compared with all three reference sites. GZ-207, GZ-213, GZ-214 and GZ-225 showed some moderate toxicity in biomass and reproduction against various reference sites. GZ-203, GZ-209 and GZ-223 were the only three site sediments that showed no reductions in survival, biomass or reproduction when compared with the three site sediments.

CERTIFICATION

I certify that the toxicity test data presented in this report were obtained under my direction or supervision in accordance with protocols of the U.S. Environmental Protection Agency, where applicable. The information is, to the best of my knowledge and belief, true, accurate, and complete.

Sediment Sample Descriptions and Test Observations

Client: GZA GeoEnvironmental, Inc.

Project: Wynn Casino Site, Everett, MA

Test start date: 4-30-15

LC-102 / C35-1873

At pre-set:
Wet, with standing water at the top of the sample container. Black in color. Fine-grained with a soupy, lose consistency. Leaves present.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

LC-105 / C35-1874

At pre-set:
Wet, with standing water at the top of the sample container. Black in color. Fine-grained with a soupy, lose consistency.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

LC-112 / C35-1875

At pre-set:
Small amount of standing water at the top of the sample container. Dark brown in color. Fine-grained, with clam and mussel shells. Faint odor of petroleum.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

GZ-203 / C35-1876

At pre-set:
Wet, with standing water at the top of the sample container. Black in color. Fine-grained with a soupy, lose consistency. Clam shells present. Faint odor of petroleum.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

GZ-207 / C35-1877

At pre-set:
Wet, with standing water at the top of the sample container. Black in color. Fine-grained with a soupy, but thick consistency. Leaves, razor clam shells and mussel shells present.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

GZ-209 / C35-1878

At pre-set:
Wet, with standing water at the top of the sample container. Black in color. Fine-grained with a soupy, lose consistency. Clam and mussel shells present. Faint odor of petroleum.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

GZ-213 / C35-1879

At pre-set:
Wet, with standing water at the top of the sample container. Very dark gray color. Gritty, but with noticeable chunks of clay. Mussel shells present. Faint odor of petroleum.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

GZ-214 / C35-1880

At pre-set:
Wet, with standing water at the top of the sample container. Dark brown, almost black in color. Fine-grained, but also with sand/grit. One small, intact clam seen. Fishy odor.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

GZ-217 / C35-1881

At pre-set:
Very thick, not as wet looking, with only a slight amount of standing water at the top of the sample container. Gray in color. Odor of petroleum. Fine grained, like clay, but also somewhat gritty.

Test Observations:
This particular sample appeared noticeably different from all others. At test initiation, several test organisms were seen swimming around in the water column, even after 24 hours. Not all test organisms entered the sediment immediately. (For all other samples and control sediments, the test organisms did enter the sediment immediately.) Eventually, the test organisms were no longer as visible, apparently entering the sediment (as shown by the appearance of small holes on the surface). The holes created by the organisms appeared smaller than the holes seen in the other samples and controls. Molted exoskeletons were less frequently observed in the test chambers for this sample.

GZ-223 / C35-1882

At pre-set:
Wet, with standing water at the top of the sample container. Black in color. Fine-grained with a soupy, lose consistency. Snail shells and other shells present. Faint odor of petroleum.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. One large, live, snail was removed from replicate C. A tube-like marine organism was seen in replicate B, although it did not survive until the end of the test period. This organisms was not identified, but was brown/orange in color, sessile, oriented vertically, and somewhat similar in appearance to an anemone. It was approximately 1 cm tall.

GZ-224 / C35-1883

At pre-set:
Wet, with standing water at the top of the sample container. Dark, blackish brown in color. Fine-grained with a soupy, lose consistency. Shell fragments present. Odor of petroleum present.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

GZ-225 / C35-1884

At pre-set:
Wet, with standing water at the top of the sample container. Black in color. Sandy/gritty in consistency, with many small stones, shells, and shell fragments. Odor of petroleum present.

Test Observations:
At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. At test initiation, the test organisms behaved normally, entering the sediment and creating small holes visible on the surface. As the test period proceeded, it became more common to see organisms roaming on the surface. The test organisms also appeared to grow, becoming visibly larger than they were at test initiation.

In Replicate A, a noticeable network of tunnels appeared against the glass within the sediment. These tunnels appeared much more developed than the less-noticeable tubes normally built by the test organisms. At test breakdown, a large, live, marine sand worm (4 – 8 cm, depending on its elongation) was found in this test replicate.

Preparation of Artificial Control Sediment

(Saltwater version for *Leptocheirus plumulosus*)

Client: GZA GeoEnvironmental, Inc.

Project: Wynn, Everett
01.0171521.13 Task 1

Date prepared: 4-29-15

Test pre-set date: 4-29-15

Test setup date: 4-30-15

Ingredients: Natural sand, sterilized natural marine sediment, and redart clay.
Artificial salt water (Instant Ocean™) used to increase pore water salinity.

Clean fine-grain sand was collected from a natural deposit in Salem, CT. Portions of this sand were rinsed through a 300 micron mesh. Also, separate portions were rinsed through a 75 micron mesh. Sand grains small enough to pass through each mesh were placed in separate containers and further rinsed. The rinsed sand was stirred into artificial salt water, to provide the final product with increased pore-water salinity. The sand was allowed to settle, and the excess salt water was decanted.

Natural marine sediment was collected (10-9-14) from the Barn Island Wildlife Management Area in Stonington, CT (and stored cold). A portion of this sediment was sieved (4-24-15), then frozen for 48 hours. It was later defrosted, and sterilized by microwaves in order to remove and/or destroy indigenous organisms. The sterilized sediment was allowed to cool.

Redart clay was obtained from Sheffield Pottery, Inc., in Sheffield, MA.

All ingredients were thoroughly blended together, and re-homogenized before use.

Amounts added:

Natural sand, ≤ 300 µm: 540 (45% by volume)

Natural sand, ≤ 75 µm: 120 ml (10% by volume)

Sterilized natural marine sediment: 480 ml (40% by volume)

Redart clay: 60 ml (5% by volume)

GZ-207:	≤ 8	GZ-225:	≤ 8

* Free-standing water found in the original sample containers was used to represent "pore water."

Overlying Test Water Ammonia:

In order to determine the ammonia levels within the overlying water of each sediment test, samples of overlying water were collected on days 0 and 28, and sent to Phoenix Environmental Laboratories, Inc., in Manchester, CT.

Additional ammonia measurements were conducted at NEB using a salicylate-based color indicator. This was done to insure that the ammonia levels within the test chambers were not above the acceptable range. Otherwise, water changes would have been performed to reduce these ammonia levels (not found to be necessary in this case). See below:

Total Ammonia: (In **mg/L**, using a salicylate-based color indicator.)

Initial Length and Weight Data - *Leptocheirus plumulosus*

Client: GZA GeoEnvironmental, Inc.

Project: Wynn - Everett (01.0171521.13 Task 1)

Organism Lot #: Lp15 (4-30) MC

Source: NEB

Date sampled / preserved: 4-30-15

Date of length measurement: 5-1-15

Four groups of ten organisms, selected randomly:

Length (mm):

	A	B	C	D
	1.5	1.2	1.9	1.2
	1.7	1.5	1.1	1.1
	1.9	1.3	1.7	1.1
	1.0	1.5	1.2	1.0
	1.8	2.1	1.4	1.4
	1.6	1.7	1.2	0.9
	1.3	1.8	0.9	1.4
	1.2	1.0	1.0	1.0
	2.0	1.4	1.2	1.1
	1.0	1.7	1.0	1.0
Mean Length:	1.5 mm	1.52 mm	1.26 mm	1.12 mm

Dry Weight:

	A	B	C	D
Pan + organisms:	931.29 mg	932.80 mg	929.98 mg	927.01 mg
- Pan (tare):	930.53 mg	931.71 mg	929.49 mg	926.67 mg
= organism weight	0.76 mg	1.09 mg	0.49 mg	0.34 mg
Qty. org. per pan:	10	10	10	10
Mean Weight:	0.076 mg	0.109 mg	0.049 mg	0.034 mg

CHEMICAL ANLAYSIS

REFERENCE TOXICANT DATA

CHAIN OF CUSTODY DOCUMENTS

PHOENIX
Environmental Laboratories, Inc.

Monday, May 11, 2015

Attn: Ms. Kim Wills
New England Bioassay
a Division of GZA GeoEnvironmental
77 Batson Drive
Manchester, CT 06040

Project ID: GZA-EVERETT SEDIMENT
Sample ID#s: BJ12838 - BJ12851

This laboratory is in compliance with the NELAC requirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

Phyllis Shiller

Phyllis Shiller
Laboratory Director

Wednesday, June 03, 2015

Attn: Ms. Kim Wills
New England Bioassay
a Division of GZA GeoEnvironmental
77 Batson Drive
Manchester, CT 06040

Project ID: GZA WYNN SEDIMENT
Sample ID#s: BJ23413 - BJ23426

This laboratory is in compliance with the NELAC requirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext. 200.

Sincerely yours,

Phyllis Shiller
